Introduction

AusAEM-1

AEM systems on the GA Deed

How does it work?

Data QA/QC (some things you'll never need to worry about)

Validation (is what you see true?)

Traps

The good stuff

GEOSCIENCE AUSTRALIA © Commonwealth of Australia (Geoscience Australia) 2019

AusAEM-1 survey

Largest (by area) AEM survey ever flown – 60,000 line km + 2,200 line km of company infill, ~ 1.1 million km²

GEOSCIENCE AUSTRALIA Commonwealth of Australia (Geoscience Australia) 2019

AEM systems on the Geoscience Australia Deed

AEM 1.01

How does AEM work?

By electromagnetic induction:

- A transmitted varying primary EM field will induce a varying secondary EM field in a conductor by electromagnetic induction
- The strength of the secondary EM field is dependent on a number of rock properties that affect the bulk electrical conductivity of the Earth

Dentith & Mudge (2014) after Grant and West (1965)

GEOSCIENCE AUSTRALIA © Commonwealth of Australia (Geoscience Australia) 2019

System geometry

Symmetrical system

(Receiver Rx inside the transmitter Tx)

Asymmetrical system (Receiver Rx outside the transmitter Tx)

GEOSCIENCE AUSTRALIA © Commonwealth of Australia (Geoscience Australia) 2019

System geometry

System geometry can affect the received signal.

Symmetrical system:

- Pitch-yaw-roll of Tx-Rx (system not 'looking' straight down)
- Relatively simple errors to solve mathematically

Asymmetrical system:

- Pitch-yaw-roll of Tx and Rx acting independently
- Rx not following straight behind, or above/below correct towing height behind Tx (system geometry)
- Highly complex errors to solve mathematically

Electrical conductivities of rocks, minerals and water

Where there is no contrast? We see nothing

GEOSCIENCE AUSTRALIA Commonwealth of Australia (Geoscience Australia) 2019

Validation of AEM data

"How do I know that what I'm looking at is real?"

There is a long, complex, QA-QC process involved, that ultimately leads to..

INVERSION

GEOSCIENCE AUSTRALIA

© Commonwealth of Australia (Geoscience Australia) 2019

The ideal EM modelling world is

A horizontally isotropic layered earth

There are risks when assuming layer-cake 1D geology, but we are often dealing with an anisotropic 2D/3D subsurface

Unfortunately the real world is not a homogeneous flat plate

Validation of AEM data

Drill hole lithology is the ultimate arbiter of truth!

Often it is very difficult to get drill holes that lie exactly on flight lines

Look for lateral continuity of conductivity patterns with mapped surface geology

GEOSCIENCE AUSTRALIA © Commonwealth of Australia (Geoscience Australia) 2019

Depth Of Investigation

"How deep are we seeing?"

The answer entirely depends on bulk conductivity conditions

Anywhere between 50 m and ~2000 m

Fig. 1. A sample conductivity depth section, comparing the results of inversions using reference models of (a) 0.04 S/m and (b) 0.004 S/m. The black line marks the depth of investigation (DOI) in each case. Above the DOI, the results are similar for both inversions, whereas below the DOI, the conductivity differs according to the reference model value.

Fig. 2. Depth of investigation (DOI) grid across the Paterson Survey. We have chosen not to interpolate between the lines of 6 km spacing in the north-west of the survey, since this may create misleading results.

Data QA/QC traps for new interpreters

- Poor system geometry/terrain clearance
- Anthropogenic effects:
 - Power lines
 - grounded metal objects (rail lines, gas/oil pipes)
 - pulsed cultural interferences (electric fences)
- Sferics (lightning)
- Inversion misfit due to excessive ground bulk conductivity
- Inversion artefacts due to sudden changes in geoelectrical stratigraphy
- Inversion artefacts due to 3D geology (folding and faulting)
- IP/SPM effects
- Direct detections ('drill-heres')

Introducing the multiplot

Plot of multiple system parameters.

Helps assess:

- System geometry
- Noise sources
- Inversion misfit
- X and Z window channels

Contractor and GA multiplots will differ only slightly

Excessive ground conductivity

Excessive ground conductivity will cause inversion misfit

AEM signal is trapped in upper portion of the Earth and will not penetrate

Normally associated with salt lakes/playas and carbonaceous shales (e.g. Eromanga Basin Wallumbilla Fm/Bulldog Shale), also airborne IP -AIP (see later)

Plenty of this in AusAEM-1 over the Eromanga Basin

Excessive ground conductivity

Excessive ground conductivity may cause inversion misfit

AEM signal is trapped in upper portion of the Earth and will not penetrate

Normally associated with salt lakes/playas and carbonaceous shales (e.g. Eromanga Basin Wallumbilla Formation/Bulldog Shale), also airborne IP - AIP (see later)

Plenty of this in AusAEM over the Eromanga Basin

>>> Flight line 2033003 - Part 1 of 3 >

Inversion artefacts due to sudden changes in geology

EM signal diffusion

The EM signal diffuses as a 'smoke ring'

Wave-front becomes wider, deeper and more attenuated with time

EM signal diffusion artifacts

A conductive body will be sensed first in late-time windows by the expanded **'smoke ring'** and appear 'deeper', creating to a leading-edge false anomaly

The body will be seen in earlier time windows as the aircraft flies overhead

Same but in reverse as the aircraft flies away, leading to a trailing-edge false anomaly

Signal 'theft'

Over-riding highly conductive unit 'steals' signal from a more weakly conductive underlying unit

The loss of signal does not necessarily mean that the more weakly conductive unit is not there; just loss of signal at depth

AusAEM-1 line 2045002

Terrain clearance

Fixed wing aircraft are not as responsive as helicopters; cannot change altitude as quickly

Terrain clearance effects become noticeable where sudden elevation changes occur

Aircraft often can not maintain the correct terrain clearance over hills

Inversion artefacts can occur:

- False resistive ground
- Pants legs

Caveat: sometimes ridges ARE resistive! AusAEM-1 line 1010001:8 CDI section

Airborne IP (AIP) and superparamagnetism (SPM)

AIP:

• Chargeable fine-grained sulphides and clays can cause IP anomalies in AEM data, trapping signal

SPM:

- Fine-grained magnetic particles (e.g. maghemite) cause slow decay of the AEM signal due to high magnetic susceptibility, giving false anomalies
- Can be recognised by flying the same line at two different heights
- Mitigate by accurate assessment of regolith materials under flight path

Both are largely removed during TEMPEST data processing, but beware in other systems, e.g. VTEM, SkyTEM, SPECTREM

GEOSCIENCE AUSTRALIA © Commonwealth of Australia (Geoscience Australia) 2019

Geological mapping and direct detection

Once you have satisfied yourself:

- that the AEM data are **fit for purpose**
- that that you can identify the various artefacts that can occur

you can get on and interpret geology and look for the good stuff

The following are some examples from AusAEM-1 and Geoscience Australia's AEM program.

Paterson Province – BM1

Discrete conductors

Sometimes you are lucky enough to see a discrete conductor

Example: Encounter Resources Yeneena Project, Paterson Province

2
